1 Power law process (PLP)

1.1 PLP intensity function

Power law process (PLP): When the intensity function of a NHPP is:

$$\lambda(t) = \frac{\beta}{\theta} \left(\frac{t}{\theta}\right)^{\beta-1} = \beta \theta^{-\beta} t^{\beta},$$

where $\beta > 0$ and $\theta > 0$, the process is called the power law process (PLP). The mean function $\Lambda(t)$ is the integral of the intensity function:

$$\Lambda(t) = \int_0^t \lambda(t) dt = \int_0^t \frac{\beta}{\theta} \left(\frac{t}{\theta}\right)^{\beta - 1} = \left(\frac{t}{\theta}\right)^{\beta}$$

1.2 PLP simulation

```
t = t[c(-1, -length(t))]
  return(t)
}
\# simulate multiple NHPPs - time truncated case
sim_mul_plp_tau = function(n_shift = 20,
                           shift_len_mean = 20, shift_len_sd = 5,
                           theta = 10, beta = 2, mean_n = 5){

   xlab('Time to event (minutes)') +
```

2 Jump Power Law Process (JPLP)

2.1 JPLP intensity function

A Bayesian hierarchical JPLP has the following intensity function:

$$\lambda_{\text{JPLP}}(t|d, s, r, \beta, \gamma_{0,d}, \gamma, \mathbf{X}_d, \mathbf{W}) = \begin{cases} \kappa^0 \lambda(t|\beta, \gamma_{0,d}, \gamma, \mathbf{X}_d, \mathbf{W}) & 0 \le t \le a_{d,s,1} \\ \kappa^1 \lambda(t|\beta, \gamma_{0,d}, \gamma, \mathbf{X}_d, \mathbf{W}) & a_{d,s,1} \le t \le a_{d,s,2} \\ \dots & \dots \\ \kappa^{R-1} \lambda(t|\beta, \gamma_{0,d}, \gamma, \mathbf{X}_d, \mathbf{W}) & a_{d,s,R-1} \le t \le a_{d,s,R} \end{cases}$$

$$= \kappa^{r-1} \lambda(t|d, s, r, \kappa, \beta, \gamma_{0,d}, \gamma, \mathbf{X}_d, \mathbf{W}) \quad a_{d,s,r-1} \le t \le a_{d,s,r},$$

$$(1)$$

where the introduced parameter κ is the percent of intensity function recovery once the driver takes a break. We assume that this κ is constant across drivers and shifts.

2.2 JPLP simulation

2.2.1 Mean function $\Lambda(t)$

```
# Mean function Lambda for JPLP
Lambda = function(t,
                  tau = 12,
                  kappa = 0.8,
                  t_{trip} = c(3.5, 6.2, 9),
                  beta = 1.5,
                  theta = 10)
  t_{trip1} = c(0, t_{trip})
  n trip = length(t trip1)
  comp = ((t_trip1[-1] - t_trip1[-n_trip])/theta)^beta
  kappa_vec = rep(kappa, n_trip)^(0:(n_trip - 1))
  comp_kappa = comp*kappa_vec[-n_trip]
  cum_comp = cumsum(comp_kappa)
  index_trip = max(cumsum(t > t_trip1))
  if(index trip == 1){
    return(((t - t_trip1[index_trip])/theta)^beta)
  }else{
```

```
return(cum_comp[index_trip - 1] + kappa^(index_trip - 1)*((t - t_trip1[index_trip])/theta)^beta)
  }
}
